Education

Carnegie Mellon University

M.S. IN MECHANICAL ENGINEERING 3.7/4.0

Pittsburgh, PA

Aug. 2014 - May. 2016

- Graduate research assistant, Visual Design and Engineering Lab
- Teaching assistant, Artificial Intelligent and Machine Learning

Shanghai Jiao Tong University

B.S. IN MARINE ENGINEERING 3.7/4.0

Shanghai, China

Sep. 2010 - June. 2014

- Outstanding graduate of Shanghai Jiao Tong University

Experience

Kitware Inc.

R&D ENGINEER

Clifton Park, NY

Jun. 2016 - Now

- **Scientific multi-threading algorithms for Massively Threaded Architectures toolkit(VTK-m)**
 - Implemented a bunch of parallel scientific algorithms(probe, histogram, etc) and improved the shared memory support for CUDA and runtime selection for TBB and OpenMP
 - Simplified and optimized the testing infrastructure which saved runtime overheads by CRTP pattern and generic programming. It reduced the binary size by 80% and improved 40% of runtime performance
 - Refactored the code base with C++11 features which simplified meta programming, improving runtime overhead as well as adding a reliable random number generation and prepare for C++14 migration
 - Added an address sanitizer nightly build and automated the uploading process to a remote nightly dashboard which catches more than 30 legacy bugs
- **Adaptable Input Output System Version 2(ADIOS2)**
 - Implemented a parallel data reader which could distribute and balance loads among many processes and visualize streaming data, in-situ data in large scale. It's capable of generating unstructured grid, uniform grid, polydata and volume data
 - Parallelized the engine tests(BP, HDF5, ADIOS1, etc) and binding tests(Python, Fortran), tested on hundreds of processor cores
 - Extended FindGoogleTesting CMake module so that it can launch MPI tests and provide a better CMake integration
- **Simulation Modeling ToolKit and Computational Model Builder framework**
 - Architected a simulation tool kit which provided a front end UI to design and visualize complicated model via Qt and GPU glyphing, adding C++11 python binding support and ability to launch parallel meshing jobs via a thread pool with commercial meshing libraries
 - Created a meteorological geo-data browser which allow users to fetch data asynchronously from remote servers and analyze them on real world map via OpenStreetMap RESTful API and MVC design pattern
 - Profiled the existing framework and redesigned its data IO serialization via nlohmann_json which improved the performance by 20%
 - Created a singleton model manager which bridged the modeling server and visualization client

Skills

DevOps	Linux, Windows, Multi threading, Meta programming, Docker, GDB, Vagrant, AWS
Framework	Qt, Google Testing, Visual Studio, Spack, Ansys APDL
Software	nlohmann_json, CUDA, OpenMP, Meshlab, TBB, OpenStreetMap, Pybind11
Open source	VTK, ParaView, SMTK, CMB, ADIOS2, Spack, CMake, Raspberry Pi
Programming	C++, CMake, Python, Git, Bash, LaTeX, Java, Fortran
